1. General Description

This document describes how BK2423 achieves long-distance communication in 250Kbps air rate on DEMO board. The BK2423 chip is the upgrade version of BK2421. The BK2423 supports not only 1Mbps and 2Mbps air rate, but also an additional 250Kbps air rate. Other functions are the same as the BK2421. (About the similarities and differences of the BK2421 and BK2423, please visit www.Inhaos.com for "AN0007-How to migrating code from RF-2400 to RF-2423" file to get more details).

2. Hardware Structure

The demo board hardware uses ATmega324pv chip with RF-2423 wireless modules. (Figure-01)
3. Software Structure

Overall software structure includes:
1. Device initialisation module: Initialize the Port, Timer and INT0 of Atmega324PV, Timer Configuration overflow period 1ms, Initialize the Bank0 and Bank1 registers of Bk2423.

2. Key scan module: Through the key switch operating modes. Operating modes includes: Master communication mode (MODE_1), Slave communication mode (MODE_2), Carrier operating mode (MODE_3).

3. RF Communication module: Master Communication, Slave Communication, Carrier detection.

Main flow (Figure-02)
3.1 BK2423 Initialization Process

As Figure-03, BK2423 initialization process. It is the same as BK2421. All Register of BK2423 is operated through the SPI interface. Sample code reference functions "Bk2423_Init(). About more information of the BK2423, please visit www.Inhaos.com for “BK2423 Datasheet v2.0" file to get more details.

3.1.2 Initial step

Initialization Step

1. Power up
2. Delay 50 ms
3. Read current Bank, if it isn’t Bank0, transfer to Bank0.
4. Write Bank0 registers, the following operation is in no order of precedence:
   - CRC, interrupt mask configuration and chip power up (REG0)
   - Enable Pipe (REG2)
- Channel (REG5)
- Set output power, LNA gain and air data rate (REG6)
- Set address field width (REG3)
- Enable pipe acknowledgement (REG1)
- Set pipe RX address (REG10 – REG15) and TX address (REG16)
- Set pipe payload length (REG17 – REG22)
- Set ARC and ARD (REG4), if ACK mode is enabled.
- If want to use Dynamic Payload Length or Payload With ACK, please send command ACTIVATE + 0x73 to chip. Then enable Dynamic Payload Length or Payload With ACK (REG28,REG29)

5. Transfer to Bank1.
6. Write REG0 – REG8 of Bank1 (MS byte first)
7. Write REG9 – REG13 of Bank1 (LS byte first)
8. Write REG14 of Bank1 (LS byte first)
9. Toggle REG4<25, 26>, write 1 to bit25, bit 26, then write 0 to them.
10. Delay 10 ms
11. Switch to Bank0

Note: When the register configuration finished must switch to the Bank0. First you should read Bank0_Reg07_Rbank bit status value, if the RBANK bit is 0 means current state is Bank0, otherwise is Bank1 state. through the SPI write "ACTIVATE+0x53" to achieve Switch.

As Figure-07, BK2423_BANK1 register initialization value, It is the same with BK2421. "Label_1" shown that receiver sensitivity mode setting of BK2423, when set for high sensitivity mode, BK2423 receiver sensitivity will enhance 2dBm, " Label_2 " shown PLL Locking Time settings of BK2423. When set PLL Locking Time 120us, the software is compatible with the BK2421, When set PLL Locking Time 130us, the software is compatible with nRF24L01+. Sample code reference functions "BK2423_BANK1_Init ( ) ".
As Figure -05 BANK0 register initialization value , RF Initialization State in sample code as below : Transmit power for 3dBm , the data rate of 250kbps , Channel for 78 , the ordinary sensitivity mode , the address length 5 bytes, using the data channel 0 as a communication channel . Sample code reference function BK2423_BANK0_Init ( ).

```c
volatile UINT32 BK2423_Bank1_Reg0_13[14]={
  0x0214D40,  //REG0
  0x00000000, //REG1
  0x00000000, //REG2
  0x13300000, //REG3
  #ifdef HIGH_SENSITIVITY_DEBUG
  0x086ED9,  //REG4 high sensitivity mode
  #else
  0x086ED9,  //REG4 normal sensitivity mode
  #endif
  #ifdef ENABLE_RSSI_DEBUG
  0xA7F023C,  //REG5 Enable RSSI measurement
  #else
  0xA7F023C,  //REG5 Disable RSSI measurement
  #endif
  0x00000000, //REG6
  0x00000000, //REG7
  0x00000000, //REG8

  #ifdef COMPARIBLE_BK2421_DEBUG
  0x0127300,  //REG12 PLL Looking time 120us compatible with BK2421
  #else
  0x0127305,  //REG12 PLL Looking time 130us compatible with nRF24L01
  #endif
  0x38B48D00,  //REG13
};
```
3.2 Air Rate Configuration

The BK2423 supports not only 1Mbps and 2Mbps air rate, but also an additional 250Kbps air rate. Air rate can be controlled by Bank0_Reg06[3,5] = RF_DR_HIGH, RF_DR_LOW. Air rate table is as below:

<table>
<thead>
<tr>
<th>Air Rate</th>
<th>Bank0_Reg06[5] = RF_DR_LOW</th>
<th>Bank0_Reg06[3] = RF_DR_HIGH</th>
</tr>
</thead>
<tbody>
<tr>
<td>2Mbps</td>
<td>0/1</td>
<td>1</td>
</tr>
<tr>
<td>1Mbps</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>250Kbps</td>
<td>1</td>
<td>0</td>
</tr>
</tbody>
</table>

Air rate configuration of BK2423 is the same with BK2421. The sample code is as below

```c
void Set_AirRate(UINT8 Rate )
{
    //Enable pipe 0, Dynamic payload length
    Bank0_Reg06[5] = RF_DR_LOW;
    Bank0_Reg06[3] = RF_DR_HIGH;
    //Enable pipe 0, Dynamic payload length
    Bank0_Reg06[0] = enable_DPL;
    //Enable pipe 0, Dynamic payload length
    Bank0_Reg06[1] = enable_DPL;
    //Enable pipe 0, Dynamic payload length
    Bank0_Reg06[2] = enable_DPL;
    //Enable pipe 0, Dynamic payload length
    Bank0_Reg06[3] = enable_DPL;
    //Enable pipe 0, Dynamic payload length
    Bank0_Reg06[4] = enable_DPL;
    //Enable pipe 0, Dynamic payload length
    Bank0_Reg06[5] = enable_DPL;
    //Enable pipe 0, Dynamic payload length
    Bank0_Reg06[6] = enable_DPL;
    //Enable pipe 0, Dynamic payload length
    Bank0_Reg06[7] = enable_DPL;
    //Enable pipe 0, Dynamic payload length
    Bank0_Reg06[8] = enable_DPL;
    //Enable pipe 0, Dynamic payload length
    Bank0_Reg06[9] = enable_DPL;
    //Enable pipe 0, Dynamic payload length
    Bank0_Reg06[10] = enable_DPL;
    //Enable pipe 0, Dynamic payload length
    Bank0_Reg06[11] = enable_DPL;
    //Enable pipe 0, Dynamic payload length
    Bank0_Reg06[12] = enable_DPL;
    //Enable pipe 0, Dynamic payload length
    Bank0_Reg06[13] = enable_DPL;
    //Enable pipe 0, Dynamic payload length
    Bank0_Reg06[14] = enable_DPL;
    //Enable pipe 0, Dynamic payload length
    Bank0_Reg06[15] = enable_DPL;
    //Enable pipe 0, Dynamic payload length
    Bank0_Reg06[16] = enable_DPL;
    //Enable pipe 0, Dynamic payload length
    Bank0_Reg06[17] = enable_DPL;
    //Enable pipe 0, Dynamic payload length
    Bank0_Reg06[18] = enable_DPL;
    //Enable pipe 0, Dynamic payload length
    Bank0_Reg06[19] = enable_DPL;
    //Enable pipe 0, Dynamic payload length
    Bank0_Reg06[20] = enable_DPL;
    //Enable pipe 0, Dynamic payload length
    Bank0_Reg06[21] = enable_DPL;
    //Enable pipe 0, Dynamic payload length
    Bank0_Reg06[22] = enable_DPL;
    //Enable pipe 0, Dynamic payload length
    Bank0_Reg06[23] = enable_DPL;
    //Enable pipe 0, Dynamic payload length
    Bank0_Reg06[24] = enable_DPL;
    //Enable pipe 0, Dynamic payload length
    Bank0_Reg06[25] = enable_DPL;
    //Enable pipe 0, Dynamic payload length
    Bank0_Reg06[26] = enable_DPL;
    //Enable pipe 0, Dynamic payload length
    Bank0_Reg06[27] = enable_DPL;
    //Enable pipe 0, Dynamic payload length
    Bank0_Reg06[28] = enable_DPL;
    //Enable pipe 0, Dynamic payload length
    Bank0_Reg06[29] = enable_DPL;
    //Enable pipe 0, Dynamic payload length
    Bank0_Reg06[30] = enable_DPL;
    //Enable pipe 0, Dynamic payload length
    Bank0_Reg06[31] = enable_DPL;
}
```

```c
{ 
    UINT8  Rt_Value  =  0;
    Rt_Value     =  SPI_Read_Reg( R_REGISTER | RF_SETUP );
    Rt_Value   &=  ~( (1 << 3) | (1 << 5) );
    Rt_Value   |=   Rate;
    SPI_Write_Reg( W_REGISTER | RF_SETUP,Rt_Value );
    SPI_Read_Reg( R_REGISTER | RF_SETUP );
}
```

### 3.3 Output Power and Sensitivity Configuration

The receiver sensitivity of BK2423 is improved about 2dB, Meanwhile the transmitting power decreased 2dB.the default setting of Bank1_REG4 is 0x0B86BED9. Output power can be controlled by RF_PWR[2:0]. The highest bit RF_PWR[2] is Bank1_Reg4[20]; and the other 2 bits RF_PWR[1:0] are Bank0_Reg6[2:1].

Output power table is as below:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>11</td>
<td>3dBm</td>
</tr>
<tr>
<td>1</td>
<td>10</td>
<td>-2 dBm (default)</td>
</tr>
<tr>
<td>1</td>
<td>01</td>
<td>-7 dBm</td>
</tr>
<tr>
<td>1</td>
<td>00</td>
<td>-15 dBm</td>
</tr>
<tr>
<td>0</td>
<td>11</td>
<td>-25 dBm</td>
</tr>
<tr>
<td>0</td>
<td>10</td>
<td>-30 dBm</td>
</tr>
<tr>
<td>0</td>
<td>01</td>
<td>-30 dBm</td>
</tr>
<tr>
<td>0</td>
<td>00</td>
<td>-40 dBm</td>
</tr>
</tbody>
</table>

(Form-3)

It recommended that you should set the Bank1_REG4[20] at fisrt during initialization ,while switching output power simply changes the BANK0,that will improve the execution efficiency of the RF.

Switch output power mode, sample code is as below:

```c
//*****************************************************************/
Function:       void BK2423_SwitchOutPower( UINT8 Power)
Parameter:       Power  [IN]  -15dBm; -7dBm; -2dBm; +3dBm
Return:         None
Description:    Bank1_REG4[20]  Bank0_REG6[2,1]
                 1           00  -15dBm  0x00
                 1           01  -7dBm   0x02
```
void Set_OutPower( UINT8 Power)
{
    UINT8 Rt_value = 0;
    Rt_value = SPI_Read_Reg( R_REGISTER | RF_SETUP );
    Rt_value &= 0xF9;
    Rt_value |= Power;
    SPI_Write_Reg( W_REGISTER | RF_SETUP, Rt_value );
}

Switch receive sensitivity flow chart is as Figure-06 below:

![Switch receive sensitivity flow chart](image_url)

Switch receive sensitivity mode,sample code is as show below:

/**************************************************************************
Function:           void Set_SenMode(UINT8 b_enable )
Parameter:
    b_enable    1:high sensitivity mode
                0:normal sensitivity mode
Return:
Description:
    set sensitivity mode
**************************************************************************/
void SPI_Bank1_Write_Reg(UINT8 reg, UINT8 *pBuf)
{
    SwitchBANK( 0x01 );       //Switch to BANK1
3.4 BK2423 Communication Module

RF Data Transmit

1. Configuration Bank0_STATUS register PRIM_RX low, into the launch mode.
2. Before transmitting data, MCU would write the address to the TX_ADDR register, and the data to the written TX FIFO register. Note that the receiving address is the same to the receiver.
3. By raising CE, to start BK2421 to send the data in the TX FIFO. CE continued high for at least 10us.
4. After transmitting BK2421 data in Auto Answer mode (auto retransmitting count is not 0), it will immediately enter the RX mode and wait to receive ACK packets. A valid ACK packet received within the time frame means data is received successfully by receiving party. At this point, TX_DS in Bank0_STATUS register will be set to 1, while data is removed from the TX FIFO registers. If still no ACK packet in max retransmitting, BK2421 will automatically set Bank0_STATUS register MAX_RT bit to 1, and transmitting failed. The outgoing data won't be removed until software clear it.
5. CE low would enter the Standby-I mode, otherwise the system will send the next packet data in TX FIFO registers. If the register is empty and the CE is high, then enter the Standby-II model.
6. Set CE low will change Standby-II mode to Standby-I mode.
RF Data Receive

Receive mode configuration:
- Set PRIM_RX to 1 in Bank0_STATUS register
- Enable data receiving channel(by setting EA_RXADDR register)
- set the data length (set by the RX_ADDR_Pn Register)
- set RX address to the corresponding channel (through RX_ADDR_Pn register)
- set automatic answer mode (by EN_AA register)

1. Raised the CE pin to start data receiving.
2. When receiving valid data (address match, CRC checksum correctly), BK2421 stored data in RX FIFO, RX_DR bit is high, and low IRQ pin.
3. When enable the automatic answer feature,BK2421 hardware will automatically switch to transmitting mode, and launch ACK response packet (Note: the transmitting address is the same to the receiving).
4. Standby mode after CE is low.

Carrier Output Module

1. Set the chip in TX mode: Write Bank0_REG [0] _BIT0 = 0, Bank0_REG0_BIT1 = 1; pull CE high.
2. Set the channel and the frequency: Write Bank0_REG [5] = 78; the corresponding frequency $F = (2400 +78) \text{ MHZ}$. 
3. Set the chip in a single carrier launch mode: Bank1_REG[04]= 0x21869ED9;
4. Set the chip in normal launch mode: Bank1_REG[04] = 0x0B869ED9
5. Sample Code reference Function “RF_CarrierOutputPro( )”

This example uses a simple one-way communication protocol, green light would flash if communication success, otherwise yellow flash.. Master communication sample code reference function mRF_Communication() , Slave communication sample code reference function “sRF_Communication ( )”. Packet format and flow chart is as below:

<table>
<thead>

About Us

INHAOS is a high-tech private limited company combined with electronic products, telecommunications equipment, computer peripheral equipment development and sales. Aiming to promote domestic IT technological progress, we develop a series of embedded product development kit. This kit comes from large quantities of commercial product. The user can use it directly for design and verification, also can quickly convert the design to production and collect new product design ideas.

We also can undertake the following services:

- Electronic product design
- Brand components acting
- Embedded development kit, Circuit module

Contact Us:  http://www.inhaos.com/about.php?alID=7
